

Active Management of IO Beta

Cello Research

November 10, 2016

IO Beta Allocation Strategy: October 2016

Commentary

- ▶ **IO Index Returns:** 0.30% for Index with Curve (EDFs+Tsy Futures) and TBA Hedges (October 2016)
- ▶ **Fund Beta Allocation YTD:** Underperformed IO Index (w/ Curve Hedges) by 823bps

IO Beta Allocation Strategy: November 2016 Outlook

- ▶ **Fixed Income Fund Allocation:** 59% (October: 50%)
- ▶ **Model 1 (IO Px/Cpn not duration-adjusted):** 50% (September: 61%)
- ▶ **Model 2 (IO Px/Cpn duration-adjusted):** 15% (September: 45%)

Active Management of IO Beta

Investigate if we can design an **active** strategy for investing in IO Beta that outperforms a **passive** strategy that is always 100% invested.

Metrics and Set-up

- ▶ Create a **Hedged IO** index
 - ▶ Hedge various IOS with current coupon TBA using model durations (Barclays) until December 2014. From 2015 onwards, use YB durations and employ TBA and Curve hedges.
 - ▶ Index is created by using monthly market value weights for each IOS based on the market weight of the corresponding cohort
 - ▶ Ginnie Mae IOS are excluded
- ▶ Simulating Passive IO Beta: Total Return and Sharpe Ratio of Hedged IO index from March 2011 - October 2016
- ▶ Simulating Active IO Beta: Dynamic allocation to Hedged IO index based on relative value metrics

Performance of Passive IO Beta Strategy: Mar 2011 - Oct 2016

- ▶ **CAGR:** 8.6%
- ▶ **Ann. Volatility:** 14.4%
- ▶ **Sharpe Ratio:** 0.6
- ▶ **% Positive Months:** 62
- ▶ **Best Month:** 11.6%
- ▶ **Worst Month:** -12.9%
- ▶ **Max Drawdown:** -23.5%
- ▶ **Drawdown Period:** June 2011 - February 2013

Framework for Active IO Beta Strategy

- ▶ Regress Hedged IO Index returns against RV metrics (1m lag):
 - ▶ IO Index Price/Coupon¹
 - ▶ Projected 1-month Carry²
 - ▶ Convexity: 60-day moving average of realized volatility on the current coupon
 - ▶ Prepayment Risk: Incentive for the Mortgage Universe
 - ▶ Yield Curve Slope: 10s-2s slope
- ▶ Calculate z-score of projected return and allocate to Beta (Net IO) based on score

¹While OAS would also be useful, in practice dealer model updates are not always appropriately back-filled which makes it challenging to get a consistent time series of values.

²This is not available on a historical basis so we use realized carry as a proxy.

Active IO Beta Strategy: Regression Results

- ▶ Significant Variables
 - ▶ High: IO Index Price/Coupon, Prepayment Risk
 - ▶ Medium: Realized Volatility
 - ▶ Low: Realized Carry, Yield Curve Slope, Index OAS
- ▶ Final Model
 - ▶ Proj. Return $\sim P_x/Cpn + Cnvx + PrepayRisk + Carry$

Active IO Beta Strategy: Beta Allocation

- ▶ Solve for $k = a + bz$ ($z = z\text{-score}$) such that we optimize the Sharpe Ratio of the strategy $k \times \text{Hedged IO Return}$.
- ▶ Set $\text{IO Beta}_{\max} = 100\%$ and $\text{IO Beta}_{\min} = -0.25\%$
- ▶ Rescale k so that it is (more or less) mapped to these boundaries.

Active IO Beta Strategy: Two Beta Allocation Models

- ▶ Model 1: Don't adjust IO Index P_X/C_{pn} for Interest Rates. $R^2 = 0.29$.
- ▶ Model 2: Adjust IO Index P_X/C_{pn} for Interest Rates.³ $R^2 = 0.18$.

³We estimate that the P_X/C_{pn} ratio moves by about 0.14 for each 10bps move in the current coupon.

Active IO Beta Strategy: Model 1 Return Profile

- ▶ **CAGR:** 9.3%
- ▶ **Ann. Volatility:** 5.4%
- ▶ **Sharpe Ratio:** 1.7
- ▶ **% Positive Months:** 76
- ▶ **Best Month:** 9.8%
- ▶ **Worst Month:** -0.9%
- ▶ **Max Drawdown:** -0.9%
- ▶ **Drawdown Period:** November 2011 - January 2012

Active IO Beta Strategy: Model 2 Return Profile

- ▶ **CAGR:** 6.9%
- ▶ **Ann. Volatility:** 5.3%
- ▶ **Sharpe Ratio:** 1.3
- ▶ **% Positive Months:** 76
- ▶ **Best Month:** 9.7%
- ▶ **Worst Month:** -3.4%
- ▶ **Max Drawdown:** -3.8%
- ▶ **Drawdown Period:** September 2011 - January 2012
